Practical No: 6

A) Aim: To implement a basic TCP socket communication model in Python that demonstrates how a server waits for client requests and how a client sends and receives data over a network connection.

Input: Server.py

```
import socket
HOST='127.0.0.1' #localhost
PORT=5000 #PORT NUMBER

server=socket.socket(socket.AF_INET,socket.SOCK_STREAM)

server.bind((HOST,PORT))

server.listen()

print(f'Server running on{HOST}:{PORT}...')

conn,addr=server.accept()
print('connected by',addr)

data=conn.recv(1024).decode()
print('client says:',data)

conn.sendall('hello from server!'.encode())

conn.close()
server.close()
```

Output:

```
Microsoft Windows [Version 10.0.26100.7171]
(c) Microsoft Corporation. All rights reserved.

C:\Users\User>cd AppData\Local\Programs\Python\Python313

C:\Users\User\AppData\Local\Programs\Python\Python313>python server.py
Server running on127.0.0.1:5000...
```

Input: client.py

```python
import socket
HOST='127.0.0.1' #server ip
PORT=5000 #server port

client=socket.socket(socket.AF_INET,socket.SOCK_STREAM)

client.connect((HOST,PORT))

client.sendall('hello server'.encode())

data=client.recv(1024).decode()
print('server says:',data)

client.close()
```

Output:

```
Microsoft Windows [Version 10.0.26100.7171]
(c) Microsoft Corporation. All rights reserved.

C:\Users\User>cd AppData\Local\Programs\Python\Python313

C:\Users\User\AppData\Local\Programs\Python\Python313>python client.py
server says: hello from server!
```

B) Aim: To write a Python program that generates a properly formatted email message using the built-in email module, including headers such as To, From, Subject, Date, and Message-ID, and outputs the complete email in raw MIME format.

Input:

```
import email.message,email.policy,email.utils,sys

text="welcmoe to advanced python"

message=email.message.EmailMessage(email.policy.SMTP)

message['To']='you@yourdomain.com'

message['From']='Learn'

message['Subject']='A mail to you'

message['Date']=email.utils.formatdate(localtime=True)

message['Messge-ID']=email.utils.make_msgid()

message.set_content(text)

sys.stdout.buffer.write(message.as_bytes())
```

Output:

```
C:\Users\User\AppData\Local\Programs\Python\Python313>python onepython.py
To: you@yourdomain.com
From: Learn
Subject: A mail to you
Date: Thu, 27 Nov 2025 18:30:52 +0530
Messge-ID: <176424845273.5272.5655836729987134269@DESKTOP-FJO594A>
Content-Type: text/plain; charset="utf-8"
Content-Transfer-Encoding: 7bit
MIME-Version: 1.0

welcmoe to advanced python
```

C) Aim: Perform a program geocoding using the Nominatim service through the geopy library in Python. It takes the name of a place as input, searches for its exact geographic location, and displays the complete formatted address along with its latitude and longitude coordinates.

Input:

```
from geopy.geocoders import Nominatim

geolocator=Nominatim(user_agent='my_python_app_123(yourmail@gmail.com)')

location=geolocator.geocode("jogeshwari")

print(location.address)

print(location.latitude,location.longitude)
```

Output:

```
>
== RESTART: C:\Users\User\AppData\Local\Programs\Python\Python313\onepython.py =
Bhayandar, Railway FOB, Bhayander East, Mira-Bhayander, Thane Taluka, Thane, Maharashtra, 401105, India
19.3101847 72.8526988
>
```

Practical No: 7

Aim: To demonstrate the use of multiple Tkinter widgets and dialogs in a single GUI application.

Input:

```
import tkinter as tk
from tkinter import *
from tkinter import ttk
from tkinter.simpledialog import askinteger,askfloat,askstring
from tkinter.filedialog import askopenfile
from tkinter.colorchooser import askcolor

root=tk.Tk()
root.title("TKINTER DEMO")
root.geometry("600x500")
root.config(bg='yellow')
#-----------

Aim: Write a program to show error handling in python.

1. **Try-except**

Input:

```
import sys
while True:
    try:
        n1=int(input("enter number 1:"))
        n2=int(input("enter number 2:"))
        print("the division is:",n1/n2)
    except:
        print("there is an error",sys.exc_info()[0])
```

Output:

```
enter number 1:10
enter number 2:5
the division is: 2.0
enter number 1:4
enter number 2:t
there is an error <class 'ValueError'>
enter number 1:
```

2. **Error as argument**

Input:

```
def Temp_Convert(a):
    try:
        return int(a)
    except ValueError as Arg:
        print("The argument does not contain number\n",Arg)

Temp_Convert("hey")
```

Output:

```
== RESTART: C:/Users/User/AppData/Local/Programs/Python/1
The argument does not contain number
 invalid literal for int() with base 10: 'hey'
```

3. **Custom error**

Input:

```
class NotEqualError(Exception):
    pass
n1=10
n2=12
try:
    if n1!=n2:
        raise NotEqualError
    else:
        print("Number are Equal")
except NotEqualError:
    print("Number does not Equal")
```

Output:

```
== RESTART: C:/Users/User/AppData
Number does not Equal
```

4. **Finally**

Input:

```
def Divide(x,y):
    try:
        result=x/y
    except ZeroDivisionError:
        print("--Division--")
    else:
            print("Result is:",result)
    finally:
        print("Final clause is executing")

Divide(21,3)
```

Output:

```
== RESTART: C:/Users/User/AppData/Lo
Result is: 7.0
Final clause is executing
```

Practical No: 9

Aim: Write a program to show different Data Science tools.

1) NumPy:

Input:

```
import numpy as np
x=np.array([1,2,3,4,5,6,7,8,9,10])
print("Array X:",x)
y=np.array([[1,2,3],[4,5,6],[7,8,9]])
print("Array Y:",y)
#array properties
print("Shape:",y.shape)
print("Size:",y.size)
print("Dimension:",y.ndim)

n=np.arange(1,11,2)
print("Array by range:",n)
```

Output:

```
== RESTART: C:\Users\User\AppData\Local\Programs\Py
Array X: [ 1  2  3  4  5  6  7  8  9 10]
Array Y: [[1 2 3]
 [4 5 6]
 [7 8 9]]
Shape: (3, 3)
Size: 9
Dimension: 2
Array by range: [1 3 5 7 9]
```

2) Pandas:

Input:

```
import pandas as pd
df=pd.read_csv(r'mydummy.csv')
print(df)
```

Output:

```
== RESTART: C:\Users\User\AppData\Loca
   id   name     age   marks
0   1   Jitesh    20     85
1   2   Neha      21     90
2   3   Drishti   19     78
3   4   Raza      22     88
```

3) Matplot:

Input:

```
import matplotlib.pyplot as plt

x=[1,2,3,4,5]
y=[1,4,9,16,25]

plt.plot(x,y)
plt.xlabel("Whole Number (X asix)")
plt.ylabel("Square of No(Y axis)")
plt.title("Graph of Square root of number")
plt.show()
```

Output:

Input: (with marker)

```
import matplotlib.pyplot as plt
import numpy as np

x_coordinates=np.array([1,2,3,4,5,6])
y_coordinates=np.array([1,4,9,16,25,36])
plt.title("This is a graph")
plt.plot(x_coordinates,y_coordinates)
plt.plot(x_coordinates,y_coordinates,marker='o')
plt.plot(x_coordinates,y_coordinates,marker='x')
plt.xlabel("Line 1")
plt.ylabel("Line 2")
plt.show()
```

Output:

4) SciPy:

a. Double Integral

Input:

```
from scipy import integrate
a=lambda y,x: x*y**2
b=lambda x:1
c=lambda x:-1
print(integrate.dblquad(a,0,2,b,c))
```

Output:

```
== RESTART: C:\Users\User\AppData\Local\Programs\Python\P
(-1.3333333333333335, 1.4802973661668755e-14)
```

b. Trimmed Standard Deviation

Input:

```
from scipy import stats
import numpy as np

x=np.arange(20)
print("Trimmed standard deviation:",stats.tstd(x))
print("\n Trimmed standard deviation by setting limit:",stats.tstd(x,(2,10)))
```

Output:

```
== RESTART: C:\Users\User\AppData\Local\Programs\Python\Python313\a
